A Thigh Lift is a surgical procedure that aims to lift and tighten the loose, sagging folds of skin in and around the thigh area. It is designed to remove excess tissue to leave a firmer, smoother contour and is suitable for patients who have experienced drastic or sudden weight loss where the tissue has been stretched and hangs down from the thighs (the buttocks can be treated with a buttock lift).

Thigh Lifts are often combined with liposuction to eliminate any unwanted fat in the thigh region.

The overall effect is to deliver a more sculpted, aesthetically pleasing thigh, firmer to the touch and with tightened, smooth overlying skin.

Loose, sagging skin distribution in the thigh can be:

- Natural, and a function of genetics
- Caused by weight loss (excess skin)
- Caused by ageing as the upper leg skin becomes loose and flabby.

As we age, the skin of our thighs loses its elasticity and begins to sag. This is especially true for those who have experienced repeated periods of weight gain and weight loss, where the skin has been stretched multiple times, destroying the elasticity leaving it sagging and loose.

Stretched skin is unlikely to shrink back naturally and typically cannot be tightened with diet and exercise. This is a common misconception, and surgical intervention may be the only way to deliver your desired results.

This sagging of the skin can cause people to become self-conscious of their body, preventing them from feeling comfortable in many clothes, particularly swimwear and sportswear.

To achieve a tighter, leaner look to your legs, a thigh lift can be a highly effective solution, so you can feel confident in your body once more.
The first step for all of our Thigh Lift patients is to meet with the surgeon we feel is best placed to perform your procedure for a consultation. At the consultation you will be able to discuss with your surgeon what your hope to achieve from the procedure, as well as discuss in detail what may or may not be possible given your existing anatomy.

Your surgeon will take you through the options available to you, and which is the most preferential for you given your stated ambitions. Having established this, several key measurements will be made and standard clinical photography will be taken.

Some questions you may want to ask your surgeon include:

- You are in good psychological and physical medical health
- You are at your ideal body weight
- You have a positive outlook and realistic expectations of what can be achieved via surgery
- You are seeking to remove excess skin in your thighs
- You are seeking to remove excess fat deposits and cellulite in your thighs
- You are seeking to improve the shape and contours of your thighs
- You are looking for long lasting results

Finally a comprehensive discussion regarding risks and complications will take place, alongside a discussion regarding what to expect in the post procedure and recovery phase. Your previous medical history will also be recorded (including previous surgery, medications, allergies etc.) and an assessment of your fitness for surgery.

If your surgeon feels you are a good candidate for surgery, you are then invited to consider whether you would like to proceed for surgery or otherwise following a two week ‘cooling off’ period.

Within this period you are welcome to come in and discuss your potential surgery with your surgeon as many times as you like.
What to expect

PHASE 2: PRE-PROCEDURE

If you choose to proceed with surgery, the next time you come into the Clinic after your final consultation will be the day of your procedure. Before admission the following behavioural changes are recommended / required:

- In the 6 weeks before your procedure we recommend smoking is discontinued as patients who smoke have a higher risk of healing more slowly and complications (see FAQs)
- In the week before your procedure you must cease taking Aspirin or any medication that contains Aspirin
- In the 6 hours prior to surgery you must not consume food or any drink, other than small sips of clear fluid (e.g. still water, black coffee, black tea) which are allowed up to 2 hours before admission

PHASE 3: DAY OF THE PROCEDURE

On the day of your procedure we ask that you arrive for your admission an hour before the agreed start time of surgery. At this point a nurse will come and record blood pressure and other relevant vitals, you will meet with your anaesthetist and your surgeon who will make the final mark-ups.

Before surgery, the surgeon will measure up the thighs to assess how much fat and/or skin needs to be removed. The thighs are then photographed, with the skin markings, in various positions, front and back. The procedure is carried out under our form of general anaesthesia called T.I.V.A. (Total Intravenous Anaesthesia) and takes two hours.

The thighs are bandaged after surgery to reduce bruising and you will feel stiff and mildly uncomfortable as you bend your legs. Most of the sutures used are dissolving to avoid stitch marks, but there may be a few to remove a week or so after surgery. Bruising lasts about 3 weeks.
What to expect

PHASE 4:
POST PROCEDURE & RECOVERY

You should not feel much pain during the procedure, but you may have some for a few days or weeks afterwards. You’ll be given painkillers if you need them.

Following the procedure, you will recover in our ambulatory recovery rooms for between two to three hours, dependent on the scale of the procedure. Once our specialist nursing team are happy that your initial recovery is complete and you are safe to return home, you will be allowed to leave the Clinic accompanied by a friend or member of your family.

Once home you will have access to our dedicated on-call nursing team 24 hours a day, 7 days a week. This team of specialists are dedicated to your comfort and pain control, and are there to field any questions you may have in the immediate post operative phase.

We ask that you come in and see our nursing team 1 week after surgery to ensure your incision sites have been properly reviewed. At this juncture we also recommend you meet with one of our on site aestheticians to discuss ongoing treatment to support the healing and scarring process.

We ask that you come in to see your surgeon after 6 - 8 weeks for a final check up.

What are the risks

Thigh Lift surgery is a safe procedure, but it is common to experience:

- bruising and swelling
- temporary numbness
- a small amount of scarring

As with all surgical procedures, thigh lift surgery carries some risk and it is possible that you might experience:

- Nausea
- Bleeding or Infection
- Poor healing of incisions and scarring
- Seroma
- a collection of blood underneath the skin (haematoma)
- death of fat tissue (fat necrosis) or embolism

Your surgeon will discuss these risks comprehensively at your consultation and explain how likely these risks and complications are, and how they would be treated.
Why Come to Cadogan Clinic for a Thigh Lift?

- Cadogan Clinic is an award winning specialist cosmetic clinic, with a track record of delivering safe, high quality cosmetic surgery

- We were founded by Mr Bryan Mayou, the surgeon who first brought Liposuction to the UK, and he has trained the next generation of specialists at the Clinic

- Unlike many of our competitors, we use the latest anaesthetic technologies to minimise your downtime, and allow you to return home on the day of your procedure

- Our nursing team provide a dedicated 24/7 oncall service during recovery – whatever your question, we can provide the answer

- We offer a complimentary consultation and treatment with our onsite team of aestheticians to ensure you heal quickly and scar well
